Water Quality Status: Fecal Coliform Bacteria

as of April 28, 2021

Background: Clean water is a valuable resource; it is essential for human health and for the health of fish, shellfish, wildlife, and livestock. Water provides irrigation for crops and a safe place for water-based recreation. To maintain safe shellfish harvest, Washington State has developed standards for fecal bacteria in marine waters. Meeting the fecal coliform benchmarks in freshwater systems leads to satisfying the marine water standards to protect public health.

Freshwater Benchmarks

Geometric Mean

Average sample contains less than:
100 fecal coliform/100mL

- and -

90th Percentile

Less than 10% of samples contain over:
200 fecal coliform/100mL

What are Fecal Coliform Bacteria?

Fecal coliform bacteria are found in human and animal feces. Detection in a creek is a sign that pathogens from these wastes may be polluting the water. Contact with fecal contaminated waters can result in **gastroenteritis, skin rashes, upper respiratory infections** and other illnesses.

E. coli are a fecal coliform bacteria

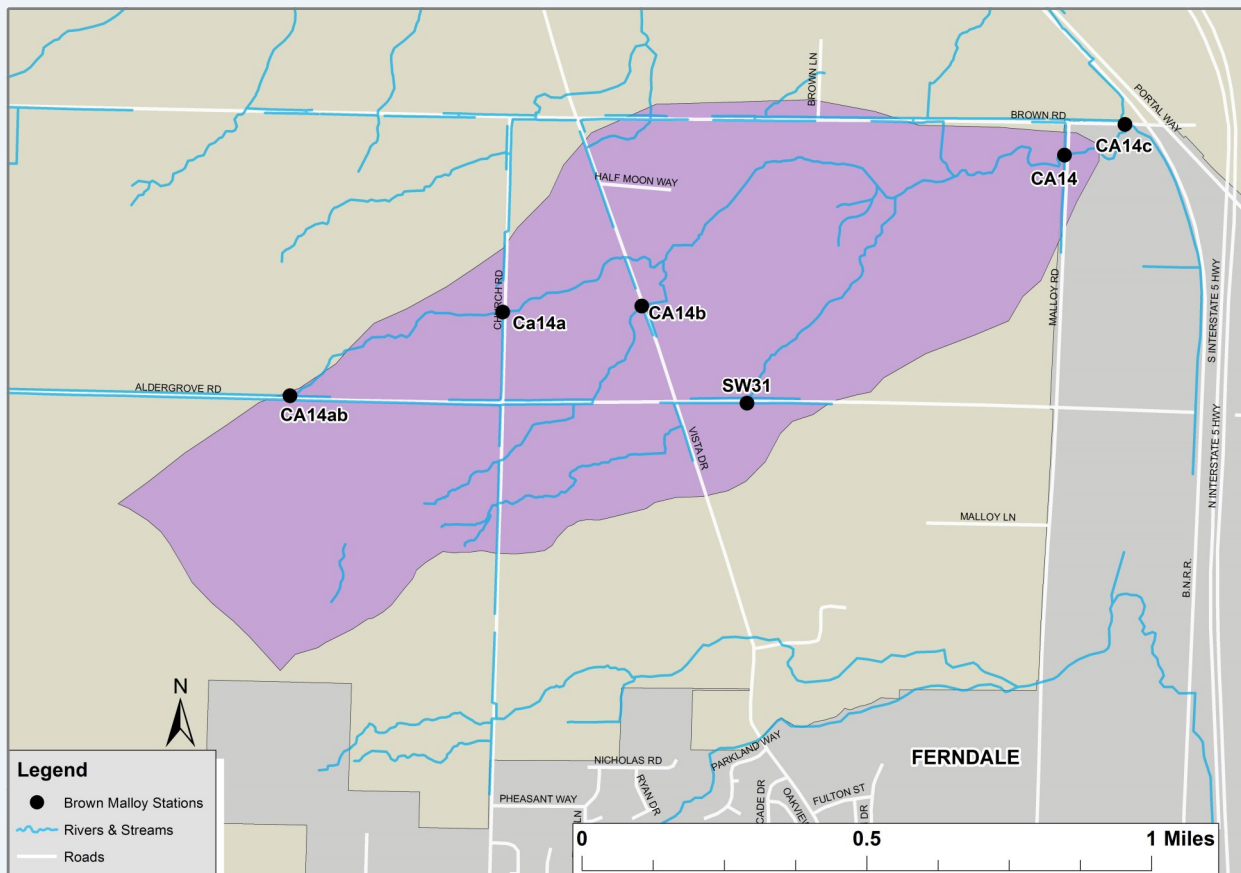

Where Does the Bacteria Come From?

Potential sources of bacteria include:

- 1) Animal waste from livestock, domestic pets, and wildlife
- 2) Human sewage from failing septic systems, leaking sewer lines or cross-connections between sewer and stormwater systems

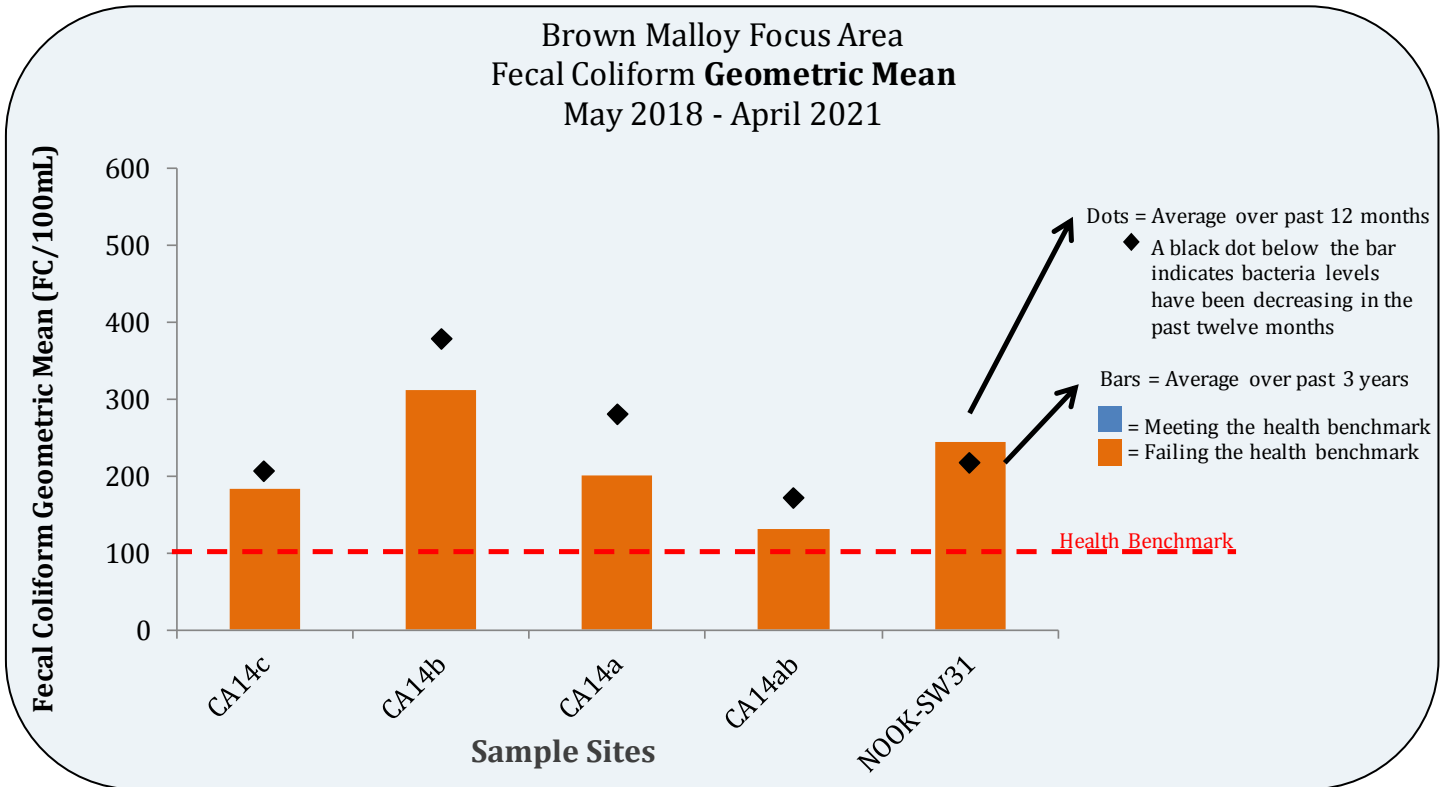

Focus Area Monitoring: The Brown Malloy drainage has been identified as a *focus area* for water quality monitoring due to high levels of bacteria observed through the routine monitoring program. Whatcom County Public Works (WCPW) has monitored fecal coliform bacterial in the Brown Malloy drainage area since 2014.

Brown Malloy Focus Area Comparison of Bacteria Levels to Health Benchmarks

Refer to the map on page 1 or the tables on pages 3-4 for site locations.

*The bar must be blue on both graphs for the sample site to be meeting the freshwater health benchmark.

Brown Malloy Focus Area

13–Month Historical Fecal Coliform Bacteria Data

These tables provide the individual results at each station for the past thirteen months. Results in light orange exceeded 200 FC/100mL. Results in dark orange exceed 1000 FC/100mL.

Gray box indicated an event where no sample was collected for varying reasons. D– Dry, ST– Stagnant, NA– Not Accessible, Temporarily Not Sampling

*Day of sampling event **Three days prior to, but not including, day of sampling event

Rainfall data is taken from the Bertrand Creek stream flow monitoring station. ¹Rainfall data was taken from CoCoRaHS Station WA-WC-29 8/2019–12/2019. Measured in inches. NR– Not Recorded

Note: These sites are seasonally dry. No samples were collected on the sample runs ranging from 7/22/20 to 9/29/20
