

Whatcom County COVID-19 Data Report

Whatcom County Health Department

Updated 3/04/22 for the period of 2/13/22 – 2/26/22

Overview

This report provides a narrative of current COVID-19 trends, data not available elsewhere online, and a more in-depth analysis of COVID-19-related topics of interest. This report references data obtained from the [Washington State Department of Health's COVID-19 Data Dashboard](#), [DOH Sequencing and Variants Report](#), [DOH Breakthrough Surveillance Report](#), and the [WCHD's Data Dashboard](#) and other COVID-related data. Note that information on these topics is rapidly evolving, and the data are always changing. This report uses the most up-to-date data available, and measures may change over time.

COVID-19 testing patterns are changing as many individuals are choosing over-the-counter (OTC) COVID-19 tests across the county. The results from these OTC tests remain largely unreported, and therefore estimates of confirmed case counts and rates may not portray the complete picture of COVID-19 activity in the county. **As a result of these factors, WCHD will be introducing changes to the reporting interval and measures in upcoming reports.** This report will be published on a bi-weekly schedule through March and then move to a monthly schedule in April assuming declining trends continue.

Key Findings

- This analysis of weekly cases, hospitalizations, and deaths has been screened for duplicate records. The state's DOH dashboard may include duplicate records from previous weeks.
- Whatcom County COVID-19 confirmed and probable case counts declined by 30% or more per week during the month of February.
- The average daily case count decreased to 41 cases per day.
- New COVID-19 hospitalizations among Whatcom residents are down to 18 for the week ending 2/26.
- The 7-day rate for COVID-19 hospitalizations by specimen date among Whatcom County residents is trending below 10 per 100k during the most recent reporting week.
- Vaccine and booster dose information is now available by age group on the state's DOH dashboard.

For the period of 2/20 – 2/26	7-Day Case Rate / 100,000
	126.8

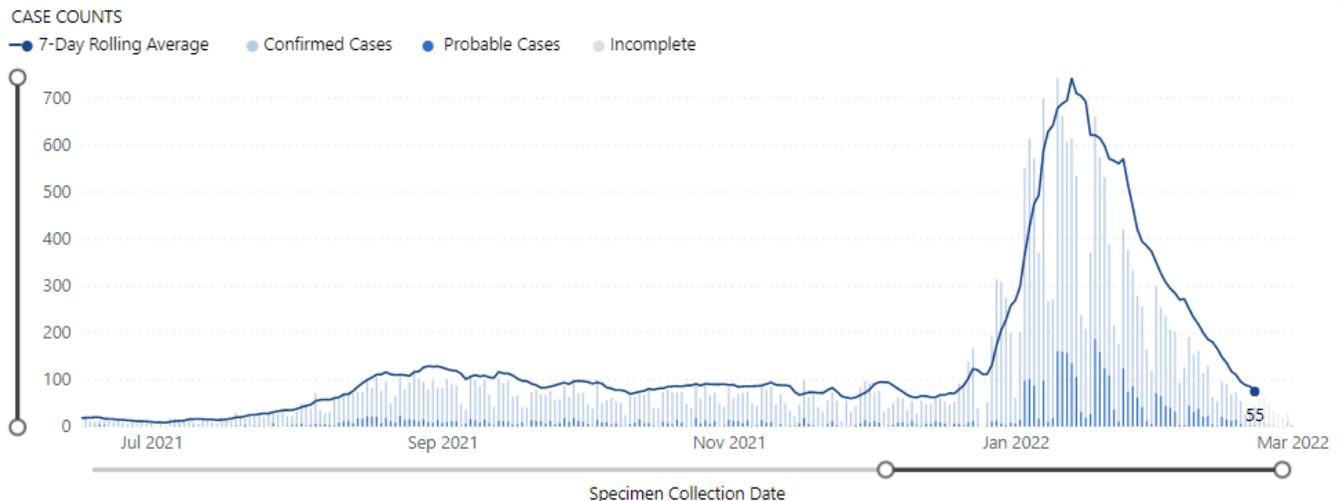

For the period of 2/15 – 2/21*	7-Day Hospitalization Rate / 100,000
	8.8

*To align with changes on the DOH Dashboard, the COVID-19 hospitalization rate is delayed to allow for completeness of the data.

Overview of COVID-19 Cases

This analysis of confirmed and probable cases for the two-week period 2/13 – 2/26 was checked for duplicate records in light of the on-going data processing issue at the DOH. The total number of confirmed and probable cases indicate a declining trend in Whatcom County. Over the month of February, this total consistently decreased by 30% or more each week. The total number of new confirmed and probable cases for the week ending 2/26 was 289 with an average case count per day of 41. This level of new COVID-19 cases represents a significant reduction from the recent peak in mid-January. However, findings from this analysis are still estimates of the actual COVID-19 activity in the county due to the continued promotion and use of OTC tests that are not included here. WCHD will continue to monitor confirmed and probable COVID-19 activity, paying close attention to potential impacts from the lifting of the mask mandate in WA State later this month. Figure 1 shows the confirmed and probable case counts for Whatcom County through 2/21 according to the state’s DOH Dashboard. The last time confirmed and probable case counts were measured at this level was in mid-December prior to the Omicron variant surge. Calculated rates and averages based on incomplete data no longer appear on this dashboard in order to focus on the most complete COVID-19 information.

COVID-19 Cases in Age Groups & Sub-County Areas

The COVID-19 case rates across many age groups in Whatcom County are trending downward in line with the over all county case rate. The case rates for all age groups are converging and are now measuring between 160 per 100,000 for 5 – 17 year-olds and 91 per 100,000 for those 65 years and older. The last time the case rate for 5 – 17 year-olds was measured at this level was in mid-August prior to the academic school year.

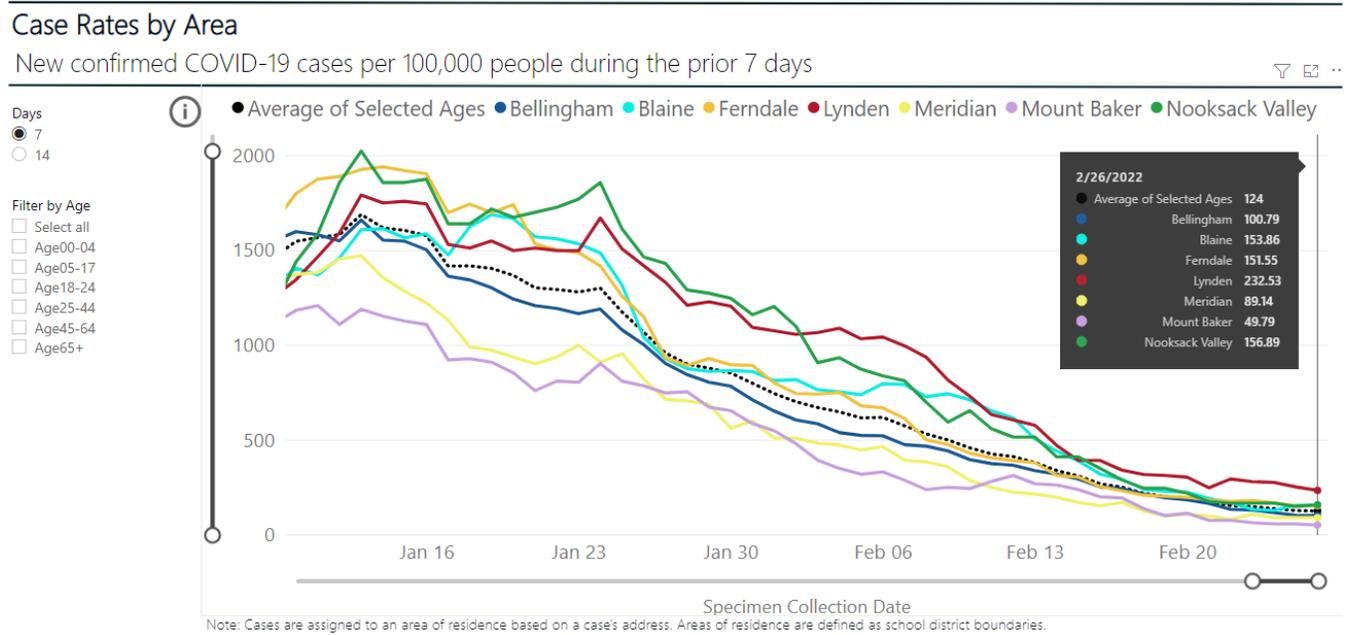

Figure 2. 7-day COVID-19 case rates per 100,000 by age groups in Whatcom County

COVID-19 Cases in Areas

The COVID-19 case rates among sub-county areas are also consistently declining. At the end of the most recent reporting week, the case rates range from 233 per 100,000 in the Lynden area down to 56 per 100,000 in the Mount Baker area. All of the sub-county area relative case rates have reached pre-Omicron levels measured in mid-December.

Figure 3. 7-day COVID-19 case rates per 100,000 by sub-county area in Whatcom County

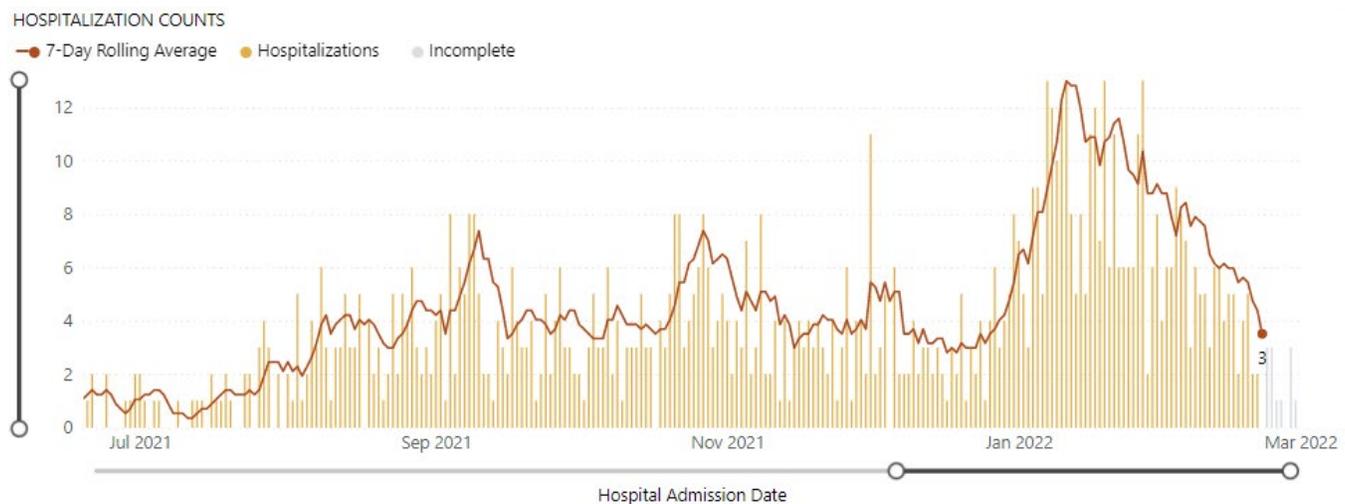

In order to present the most accurate information related to cases, hospitalizations, and deaths by vaccination status, WCHD will be reporting these numbers with greater context related to the changing underlying population numbers in the future on a monthly timeline. In the meantime, an analysis of COVID-19 Cases, Hospitalizations, and Deaths by Vaccination Status is available in the corresponding [DOH report](#).

COVID-19 Hospitalizations

A “COVID-19 hospitalization” is a Washington resident identified using case investigation data in the Washington Disease Reporting System (WDRS) or linkage with Rapid Health Information Network (RHINO) records as hospitalized with confirmed or probable COVID-19. The 7-day rate for COVID-19 hospitalizations in this report describes the number of COVID-19 hospitalizations among Whatcom County residents in a seven-day period divided by the county population.

COVID-19 hospitalization data available on the DOH Dashboard is shown in Figure 4. Caution should be taken when interpreting hospitalization rates within the most recent eight days because of the incompleteness of the data (noted with grey bars). As noted above, calculated rates and averages are no longer included on these graphs.

Figure 4: COVID-19 hospitalization counts for Whatcom County residents with confirmed data through 2/21 (Source: DOH)

Note: PeaceHealth reports the number of COVID-19 positive patients, a measure of the number of people who are hospitalized for any reason/diagnosis and who have also tested positive for COVID-19. Their care requires COVID-19 protocols to prevent infection of others in the hospital, regardless of the severity of their illness. This number is helpful in understanding changes in our hospital's COVID unit capacity, as caring for COVID-positive patients is resource-intensive.

For the two-week period ending 2/26, there were 50 new COVID-19 hospitalizations reported among Whatcom County residents. The total for each week was 32 hospitalizations for the week ending 2/19 and 18 hospitalizations for the week ending 2/26. This represents a steady decline from the previous weeks that is in line with decreasing cases. Among the new COVID-19 hospitalizations for the most recent reporting week, 50% were 65 years and older, 28% were between 45 and 64 years, and 22% were between 25 and 44 years. No hospitalizations occurred among individuals less than 25 years. Throughout the month of February, COVID-19 hospitalizations have steadily declined among Whatcom County residents; however, those 65 years and above consistently make up the greatest proportion of those hospitalized. For an analysis of hospitalizations by vaccination status, the [DOH Report](#) on COVID-19 Cases, Hospitalizations, and Deaths is available.

COVID-19 Deaths

WCHD is working on other measures to report deaths that better represent the distribution of these events across the population and consider the additional vaccinations that are now common. Further details will be available as they are confirmed in the coming weeks. An analysis of deaths by vaccination status is available in the state's [DOH report](#) on COVID-19 Cases, Hospitalizations, and Deaths by Vaccination Status.

Whatcom County saw ten deaths due to COVID-19 during the period 2/13 – 2/26:

- Female, 40-49 years
- Female, 50-59 years
- Female, 60-69 years
- Female, 70 -79 years
- Female, 80-89 years
- Male, 50-59 years
- Male, 60-69 years
- Male, 70-79 years
- Male, 80-89 years
- Male, 90-99 years

The total number of deaths due to COVID-19 among Whatcom County residents reached 270 as of 2/26. These numbers are preliminary; WCHD may not yet have been notified of other deaths for these reporting weeks.

COVID-19 Vaccinations

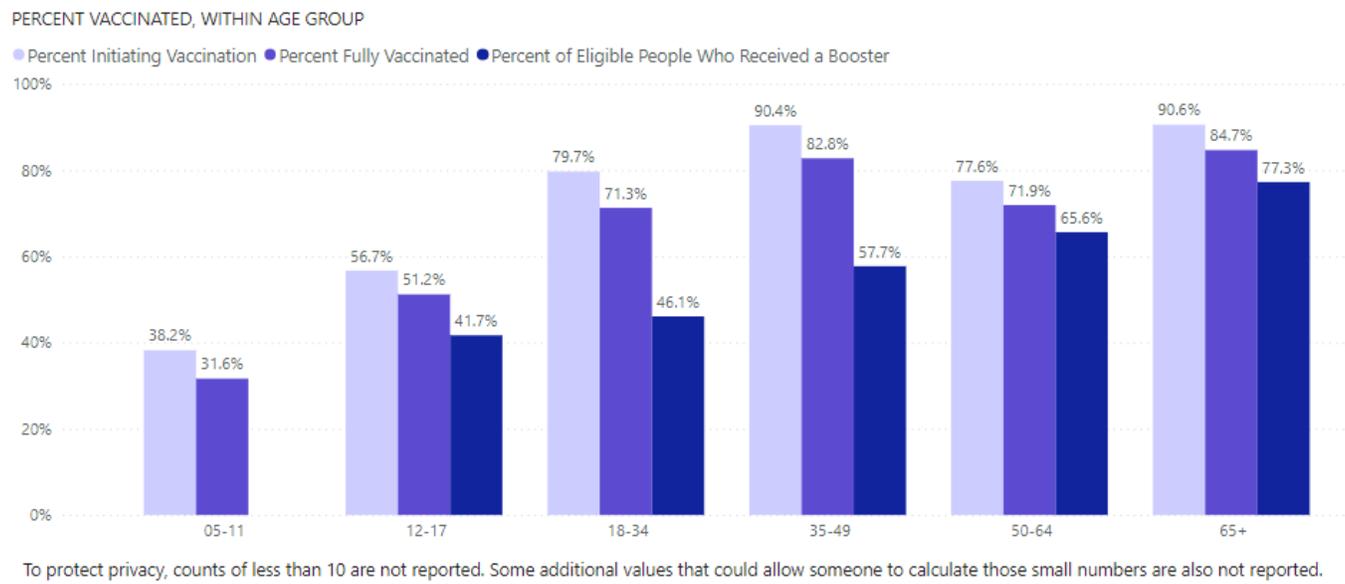

The percent coverage for COVID-19 vaccinations among the population is displayed in Table 4 as of February 26. Of the eligible population (5+ years), there are approximately 46,000 Whatcom County residents who have not initiated vaccination.

Table 1: Percent of population who are initiating vaccination and fully vaccinated in Whatcom County.

	Initiating (%)	Fully Vaccinated (%)
Total Population	74.4	67.9
Population 5+	78.3	71.5

The state’s DOH Dashboard provides information on the percent of individuals who have received COVID-19 vaccinations including booster doses by age group and county. In Whatcom County, beginning with individuals 12 years and above, the percent of individuals receiving a booster dose increases with age.
